Max THC (and Max CBD) are calculated values for total cannabinoids after heating, assuming complete decarboxylation of the acid to the neutral form. It is calculated based on the weight loss of the acid group during decarboxylation: Max THC = (0.877 x THCA) + THC. This calculation does not include other cannabinoid isomers (eg. D8-THC and exo-THC). NT = Not tested. LOQ = Limit of Quantitation; The reported result is based on a sample weight with applicable moisture content for that sample; Unless otherwise stated all quality control samples performed within specifications established by the Laboratory.
